

## Topic 12 – The Periodic Table

Subject content:

### Content

- Periodic trends
- Group properties
- Transition elements

### Learning outcomes

#### Periodic trends

- describe the Periodic Table as an arrangement of the elements in the order of increasing proton (atomic) number
- describe how the position of an element in the Periodic Table is related to proton number and electronic structure
- describe the relationship between group number and the ionic charge of an ion of an element
- explain the similarities between the elements in the same group of the Periodic Table in terms of their electronic structure
- describe the change from metallic to non-metallic character from left to right across a period of the Periodic Table
- describe the relationship between group number, number of valency electrons and metallic / non-metallic character
- predict the properties of elements in Group I and Group VII using the Periodic Table.

#### Group properties

- describe lithium, sodium and potassium in Group I (the alkali metals) as a collection of relatively soft, low-density metals showing a trend in melting point and in their reaction with water
- describe chlorine, bromine and iodine in Group VII (the halogens) as a collection of diatomic, nonmetals showing a trend in colour, state and their displacement reactions with solutions of other halide ions
- describe the elements in Group 0 (the noble gases) as a collection of monatomic elements that are chemically unreactive and hence important in providing an inert atmosphere, e.g. argon and neon in light bulbs; helium in balloons; argon in the manufacture of steel
- describe the lack of reactivity of the noble gases in terms of their electronic structures.

#### Transition elements

- describe typical transition elements as metals having high melting point, high density, variable oxidation state and forming coloured compounds
- state that the elements and/or their compounds are often able to act as catalysts (see also 6.1(d)).

## 12.1 Features of the Periodic Table

**Periodic Table:** list of elements arranged in order of increasing proton number

Group																											
I	II													III	IV	V	VI	VII	0								
<div>Key</div> <div>proton (atomic) number</div> <div>atomic symbol</div> <div>name</div> <div>relative atomic mass</div>												<div>1</div> <div>H</div> <div>hydrogen</div> <div>1</div>														<div>2</div> <div>He</div> <div>helium</div> <div>4</div>

actinoids

Divides elements into

Division	Description	Numbering	Properties of atoms of elements
1. <b>Periods</b>	Vertical column	8 groups (I to VIII)	Same number of electron shells
2. <b>Groups</b>	Horizontal row	7 periods (1 to 7)	Same number of valence electrons

## 12.2 Periodic Trends

### Metallic and non-metallic properties

Metallic properties: determined by how easily / readily atom of element loses electrons

Trend	Atom	Attractive forces between valence electrons & nucleus	Lose valence electrons
Going down group	size increases	weaker	more easily / readily
Across period	no. of proton increases	stronger	harder

### Electronic structure

Period number = no. of electron shells

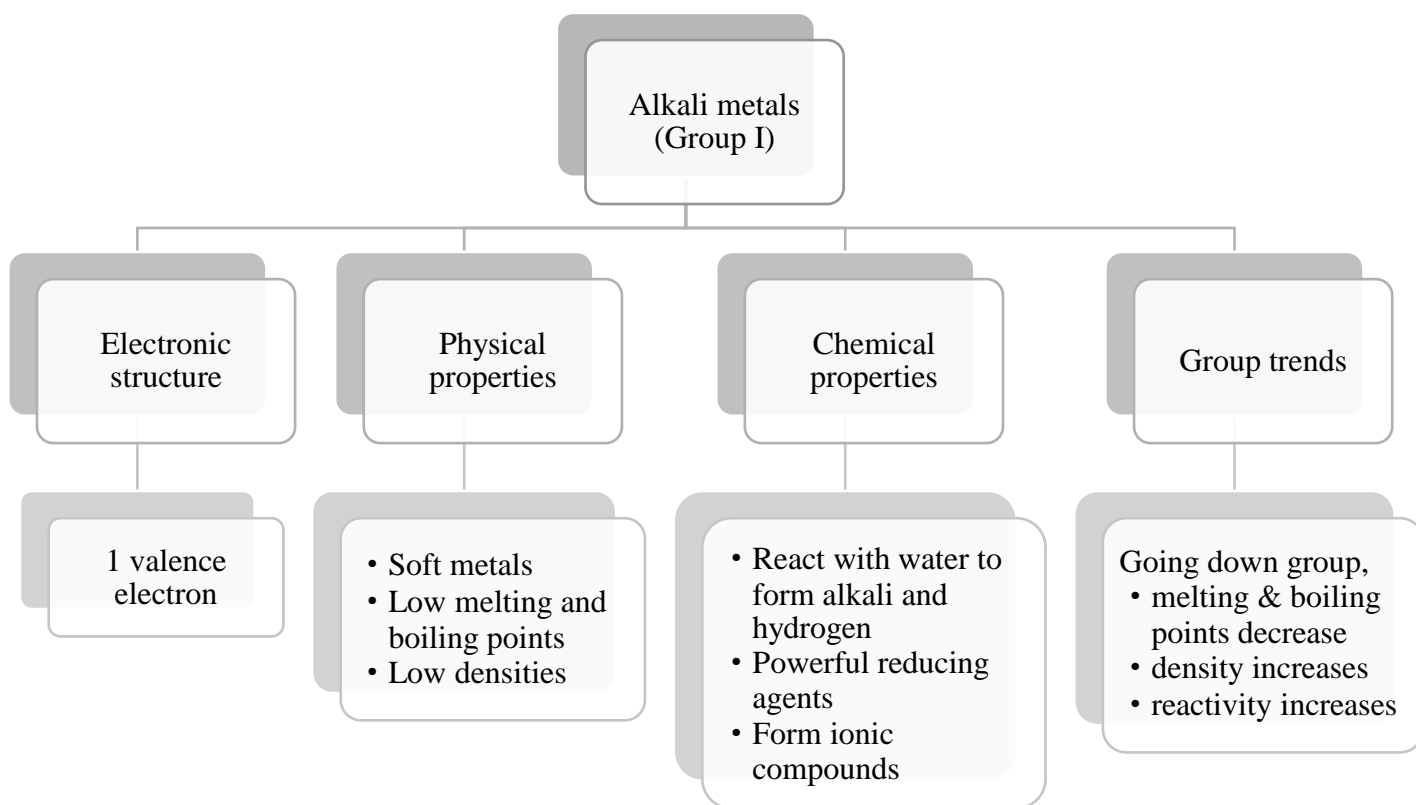

Group number = no. of valence electrons

## Charge of ion

Group number and ion formed

Group	Type of ion	Charge	Example	Explanation
I	positive	+1	Na <sup>+</sup>	<ul style="list-style-type: none"><li>Metals: lose electrons → positive ion</li><li>Group number = charge</li></ul>
II		+2	Mg <sup>2+</sup>	
III		+3	Al <sup>3+</sup>	
IV	covalent		CH <sub>4</sub>	<ul style="list-style-type: none"><li>Share electrons → covalent bond</li><li>Group number = maximum oxidation state</li></ul>
V			PCl <sub>5</sub>	
VI	negative	-2	O <sup>2-</sup>	<ul style="list-style-type: none"><li>Non-metals</li><li>Gain electrons → negative</li></ul>
VII		-1	Cl <sup>-</sup>	
0	-			<ul style="list-style-type: none"><li>Stable electronic structure</li><li>Do not form compounds</li></ul>

## 12.3 Group I Elements – Alkali Metals

Physical properties	Chemical properties
<ol style="list-style-type: none"><li>1. Soft (can be cut easily)</li><li>2. Low <i>mp</i> &amp; <i>bp</i></li><li>3. Low density (Li, Na, K float on water)</li></ol>	<ol style="list-style-type: none"><li>1. React with cold water to form alkali + hydrogen</li><li>2. Powerful reducing agents (give away electrons readily)</li><li>3. Form ionic compounds</li></ol>

Trend: going down group I,

Physical properties	Chemical properties
<ol style="list-style-type: none"><li>1. <i>mp</i> &amp; <i>bp</i> ↓</li><li>2. Density ↑</li></ol>	Reactivity increases (Li < Na < K)

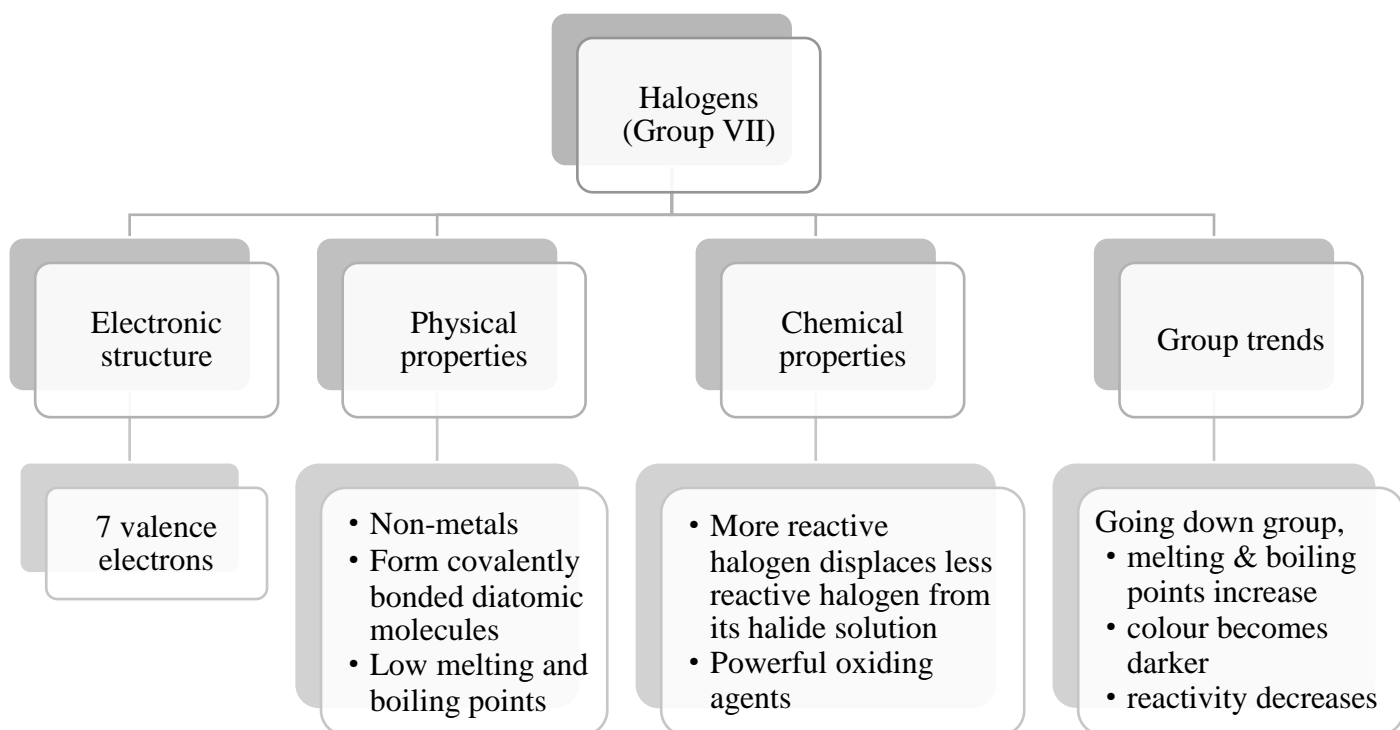

Metal atom lose valence electrons more readily → more reactive

- Size of atom increases
- Valence electrons become further from nucleus
- Force of attraction between valence electrons & nucleus becomes weaker
- Easier to lose valence electrons

React with cold water (single displacement reaction)

Alkali metal	Reactivity with cold water	Storage
1. <b>Lithium</b> (Li)	$2 \text{Li}(s) + 2 \text{H}_2\text{O}(l) \rightarrow 2 \text{LiOH}(aq) + \text{H}_2(g)$ <ul style="list-style-type: none"> <li>• React vigorously</li> <li>• Float on water</li> <li>• Effervescence of <math>\text{H}_2</math></li> </ul>	Stored in oil (highly reactive metals) – prevent from reacting with air and water
2. <b>Sodium</b> (Na)	$2 \text{Na}(s) + 2 \text{H}_2\text{O}(l) \rightarrow 2 \text{NaOH}(aq) + \text{H}_2(g)$ <ul style="list-style-type: none"> <li>• Reacts violently</li> <li>• Melt → silvery ball</li> <li>• Dart about on surface of water quickly</li> <li>• Burn with yellow flame</li> <li>• <math>\text{H}_2</math> catch fire &amp; explode (enough heat produced)</li> </ul>	
3. <b>Potassium</b> (K)	$2 \text{K}(s) + 2 \text{H}_2\text{O}(l) \rightarrow 2 \text{KOH}(aq) + \text{H}_2(g)$ <ul style="list-style-type: none"> <li>• React very violently</li> <li>• Dart about on surface of water very quickly</li> <li>• Burns with lilac flame</li> <li>• <math>\text{H}_2</math> catch fire &amp; explode (enough heat produced)</li> </ul>	

## 12.4 Group VII Elements – Halogens

Physical properties	Chemical properties
1. Diatomic covalent molecules 2. Low melting and boiling points 3. Coloured	1. Undergo displacement reactions with halide solutions 2. Halogens are powerful oxidising agents

Trend: going down group VII,

Physical properties	Chemical properties
Melting and boiling points increase Colours become darker	Reactivity decreases ( $F > Cl > Br > I > At$ )

Physical states:

Element	State (r.t.p.)	Melting point (°C)	Boiling point (°C)
fluorine (F)	pale yellow <b>gas</b>	-220	-188
chlorine (Cl)	greenish-yellow <b>gas</b>	-101	-34
bromine (Br)	<u>reddish-brown</u> <b>liquid</b>	-7	59
iodine (I)	<u>purplish-black</u> <b>solid</b>	114	184
astatine (At)	black <b>solid</b>	302	337

**Displacement reaction:** more reactive halogen displaces less reactive halogen from its halide solution

	Potassium chloride (KCl)	Potassium bromide (KBr)	Potassium iodide (KI)
Chlorine ( $Cl_2$ )		$Cl_2(aq) + 2 KBr(aq) \rightarrow 2 KCl(aq) + Br_2(aq)$ <b>Reddish-brown</b> mixture	$Cl_2(aq) + 2 KI(aq) \rightarrow 2 KCl(aq) + I_2(aq)$ <b>Brown</b> mixture
Bromine ( $Br_2$ )	No reaction		$Br_2(aq) + 2 KI(aq) \rightarrow 2 KBr(aq) + I_2(aq)$ <b>Brown</b> mixture
Iodine ( $I_2$ )	No reaction	No reaction	

React with most metals  $\rightarrow$  **metal halides** (exothermic)

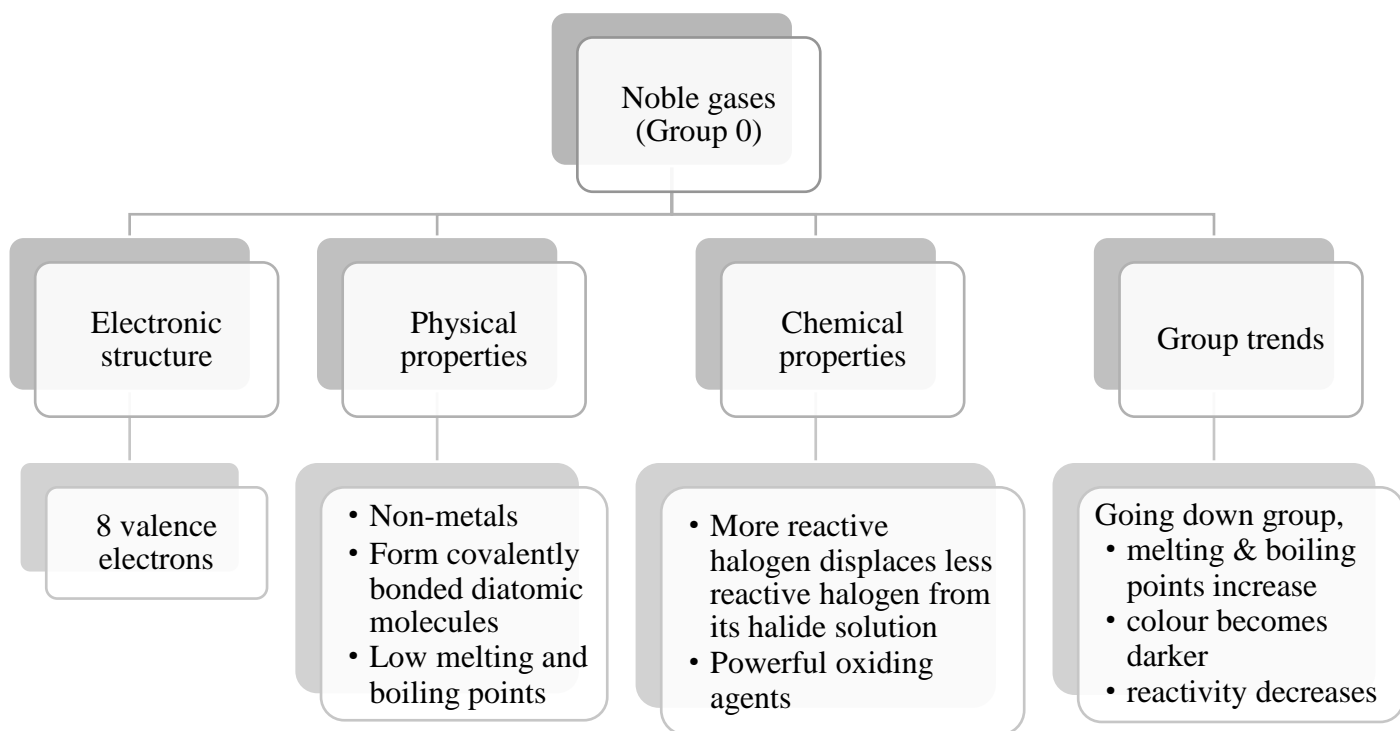

React with hydrogen  $\rightarrow$  hydrogen halides (exothermic)

Different states of iodine ( $I_2$ ):

Iodine	Colour
$I_2(s)$	Purple solid
$I_2(l)$	(sublimes)
$I_2(g)$	Purple gas
$I_2(aq)$	Brown solution <ul style="list-style-type: none"> <li>• Low solubility in water</li> <li>• High solubility in alcohol <math>\rightarrow</math> purple solution</li> </ul>

## 12.5 Group 0 Elements – Noble Gases

Physical properties	Chemical properties
1. Colourless gases (r.t.p.) 2. Low <i>mp</i> & <i>bp</i> 3. Insoluble in water	1. Monoatomic 2. Unreactive

Noble gases are unreactive:

- Full valence electron shell → full electronic structure
- Do not lose, gain or share electrons
- Stable & rarely react to form compounds

### Uses

Mostly used to provide **inert atmosphere**

Gas	Usage
1. <b>Helium</b> (He)	Fill weather balloons
2. <b>Neon</b> (Ne)	Fill lights and advertising signs
3. <b>Argon</b> (Ar)	Fill light bulbs / provide inert atmosphere during welding
4. <b>Krypton</b> (Kr)	Flash bulbs for photography
5. <b>Xenon</b> (Xe)	Vehicle headlamps and lasers

## 12.6 Transition Elements

### Properties

Physical and chemical properties

Property	Explanation													
1. High <i>mp</i> & <i>bp</i>	Compared Group I & II metals (other metals)													
2. High densities														
3. Variable oxidation states	<ul style="list-style-type: none"> <li>Metals in Group I &amp; II: form one type of positive ion only → oxidation state: +1 / +2</li> <li>Transition metals: form ions with different oxidation states</li> </ul>													
4. Form coloured compounds	<ul style="list-style-type: none"> <li>Different colours of compounds of transition metal at different oxidation states</li> <li>Colour of hydrated compound: different from anhydrous compound</li> <li>Compounds of transition metals → produce different colours                             <ul style="list-style-type: none"> <li>(a) dyes</li> <li>(b) pigments</li> <li>(c) paints</li> <li>(d) stained glass</li> </ul> </li> </ul>													
5. Good catalysts	<ul style="list-style-type: none"> <li>Important catalysts for many reactions (laboratory + industry)</li> <li>Some uses:                             <table border="1"> <thead> <tr> <th>Catalyst</th><th>Industrial process</th></tr> </thead> <tbody> <tr> <td>iron</td><td>Haber process (manufacture ammonia)</td></tr> <tr> <td>nickel</td><td>hydrogenation of vegetable oil (manufacture margarine)</td></tr> <tr> <td>platinum-rhodium</td><td>catalytic converter</td></tr> <tr> <td>titanium(III) chloride</td><td rowspan="2">polymerisation of alkenes</td></tr> <tr> <td>titanium (VI) chloride</td></tr> <tr> <td>manganese(IV) oxide</td><td>decomposition of hydrogen peroxide  <math display="block">2 \text{H}_2\text{O}_2 \xrightarrow{\text{MnO}_2} 2 \text{H}_2\text{O} + \text{O}_2</math> </td></tr> </tbody> </table> </li> </ul>	Catalyst	Industrial process	iron	Haber process (manufacture ammonia)	nickel	hydrogenation of vegetable oil (manufacture margarine)	platinum-rhodium	catalytic converter	titanium(III) chloride	polymerisation of alkenes	titanium (VI) chloride	manganese(IV) oxide	decomposition of hydrogen peroxide $2 \text{H}_2\text{O}_2 \xrightarrow{\text{MnO}_2} 2 \text{H}_2\text{O} + \text{O}_2$
Catalyst	Industrial process													
iron	Haber process (manufacture ammonia)													
nickel	hydrogenation of vegetable oil (manufacture margarine)													
platinum-rhodium	catalytic converter													
titanium(III) chloride	polymerisation of alkenes													
titanium (VI) chloride														
manganese(IV) oxide	decomposition of hydrogen peroxide $2 \text{H}_2\text{O}_2 \xrightarrow{\text{MnO}_2} 2 \text{H}_2\text{O} + \text{O}_2$													

Differences in properties of Group I metals and transition metals

Group I metals	Transition metals
<ul style="list-style-type: none"> <li>Lower melting point</li> <li>Lower density</li> </ul>	<ul style="list-style-type: none"> <li>Higher melting point</li> <li>Higher density</li> </ul>
<ul style="list-style-type: none"> <li>Form white compounds</li> <li>Form ions with oxidation state +1</li> </ul>	<ul style="list-style-type: none"> <li>Form coloured compounds</li> <li>Form ions with different oxidation states</li> </ul>

## Typical questions

### Structured questions

1. Suggest a reason why alkali metals are commonly stored in oil.

Alkali metals are highly reactive metals. They are stored in oil to prevent them from reacting with air and water.

2. Describe a simple test carried out to:

- (a) test the pH of the solution formed after reaction of alkali metals with water.

Add a few drops of Universal indicator into the solution. Universal indicator will change from green to purple.

- (b) identify the gas evolved when lithium reacts with water.

Place a lighted splint where the gas evolved. The lighted splint is extinguished with a 'pop' sound. The gas is hydrogen.

3. Study the table below about some properties of elements in Period 4.

Element	Electronic configuration	Melting point (°C)	Density (g/cm <sup>3</sup> )	Formula of oxide(s)	Colour of one of its chlorides
Potassium	2.8.8.1	63.5	0.86	K <sub>2</sub> O	white*
Calcium	2.8.8.2	842	1.55	CaO	white*
Scandium	2.8.9.2	1541	2.99	Sc <sub>2</sub> O <sub>3</sub>	white*
Titanium	2.8.10.2	1668	4.51	TiO, TiO <sub>2</sub> , Ti <sub>2</sub> O <sub>3</sub>	violet
Vanadium	2.8.11.2	1910	6.11	VO, VO <sub>2</sub> , V <sub>2</sub> O <sub>3</sub> , V <sub>2</sub> O <sub>5</sub>	pale green
Chromium	2.8.13.1	1907	7.14	CrO, CrO <sub>2</sub> , CrO <sub>3</sub> , Cr <sub>2</sub> O <sub>3</sub>	dark green
Manganese	2.8.13.2	1246	7.47	MnO, MnO <sub>2</sub> , Mn <sub>2</sub> O <sub>3</sub>	pink
Iron	2.8.14.2	1538	7.87	FeO, Fe <sub>2</sub> O <sub>3</sub> , Fe <sub>3</sub> O <sub>4</sub>	pale green
Cobalt	2.8.15.2	1495	8.90	CoO, Co <sub>2</sub> O <sub>3</sub> , Co <sub>3</sub> O <sub>4</sub>	red
Nickel	2.8.16.2	1455	8.91	NiO, Ni <sub>2</sub> O <sub>3</sub>	green
Copper	2.8.18.1	1084	8.92	Cu <sub>2</sub> O, CuO	blue-green
Zinc	2.8.18.2	419	7.14	ZnO	white*

Describe the trend in the melting point of the elements from potassium to copper.

The melting point increases from potassium to vanadium, then decreases from vanadium to zinc, except for manganese.
