

## Chapter 1 – Measurement

### 1.1 What is Physics?

Physics: study of natural world

- Major topics:
  1. General Physics
  2. Thermal Physics
  3. Light
  4. Waves and Sound
  5. Electricity and Magnetism
- Related to 2 main ideas
  1. Matter
  2. Energy

### 1.2 Physical Quantities and SI Units

Physical quantity consists of:

1. **Numerical magnitude**
2. **Unit**

7 base quantities

**SI units:** from International System of Units

Base quantity	SI unit	Symbol
Length	metre	<b>m</b>
Mass	kilogram	<b>kg</b>
Time	second	<b>s</b>
Electric current	ampere	<b>A</b>
Thermodynamic temperature	kelvin	<b>K</b>
Luminous intensity	candela	<b>cd</b>
Amount of substance	mole	<b>mol</b>

#### Derived quantities

- physical quantities derived from base quantities
- Examples
  - (a) Speed ( $\text{m/s}$ )
  - (b) Area ( $\text{m}^2$ )
  - (c) Volume ( $\text{m}^3$ )
  - (d) Density ( $\text{kg/m}^3$ )
  - (e) Force ( $\text{N/m}^2$ )

**Prefixes** – more convenient, less risk of miscounting

Factor	Prefix	Symbol
$10^9$	<b>giga</b>	G
$10^6$	<b>mega</b>	M
$10^3$	<b>kilo</b>	k
$10^{-1}$	<b>deci</b>	d
$10^{-2}$	<b>centi</b>	c
$10^{-3}$	<b>mili</b>	m
$10^{-6}$	<b>micro</b>	$\mu$
$10^{-9}$	<b>nano</b>	n

Standard form:

**$a \times 10^n$**  where  $1 \leq a < 10$

### 1.3 Measurement of Length

Magnitudes of sizes of common objects

Common objects	Magnitude in size (m)
Planet Earth (diameter)	$10^7$
Moon (diameter)	$10^6$
Height of tall mountain	$10^3$
Length of football field	$10^2$
Height of chair	$10^{-1}$
Width of paper	$10^{-4}$
Size of human cell	$10^{-6}$
Size of large molecule	$10^{-9}$
Size of an atom	$10^{-10}$

Measuring instruments

Instrument	Range	Precision (cm)
1. <b>Measuring tape</b>	0 – 5 m	0.1
2. <b>Metre rule</b>	0 – 1 m	0.1
3. <b>Vernier calipers</b>	0 – 15 cm	0.01
4. <b>Micrometer screw gauge</b>	0 – 2.5 cm	0.001

## Metre rule and tape measure

**Precision:** smallest unit an instrument can measure

Avoid measurement errors:

1. **Parallax errors:** line of sight perpendicular to rule
2. Wear and tear: zero mark unsuitable for measuring purposes  
→ measure from another point, subtract from final reading
3. Take several readings, calculate average

## Measurement errors

Types

Random error	Systematic error
Unpredictable	Predictable
Minimised by taking average of multiple readings	Eliminated by mitigating against sources of error
1) Parallax error 2) Estimate last digit of instrument reading	1) Parallax error 2) Zero error

Explanation

Type of error	Explanation	Causes
1. <b>Random error</b>	<ul style="list-style-type: none"> <li>• Occur in all measurements</li> <li>• Unpredictable</li> <li>• Reduced by repeating measurements, obtain average</li> </ul>	<ol style="list-style-type: none"> <li>1) <b>Estimation of last figure of reading</b> (inadequate/low precision)</li> <li>2) Limitation in <b>experimental techniques</b> <ul style="list-style-type: none"> <li>• <u>human reaction error</u> – stopwatch</li> <li>• improper <u>alignment of optical pin</u> with image formed by glass block</li> </ul> </li> <li>3) <b>Unpredictable conditions</b> / changes in experiment → <u>Manufacturing inconsistency</u> – thickness of test tube vary along length</li> </ol>
2. <b>Systematic error</b>	Consistent of underestimation / overestimation of reading	<ol style="list-style-type: none"> <li>1) Error / <b>imperfection of equipment</b> → <u>Zero error</u> of instrument <ul style="list-style-type: none"> <li>• check before &amp; after measuring</li> <li>• account it when calculating actual length</li> </ul> </li> <li>2) <b>Wrong method</b> / technique <ul style="list-style-type: none"> <li>• Wrong <u>meniscus level</u> when obtaining burette readings</li> <li>• <u>Parallax error</u> – reading instrument at angle (consistently high / low reading)</li> </ul> </li> </ol>

## Vernier calipers

### Parts

Part	Usage
1. <b>Main scale</b>	Read measurement
2. <b>Sliding vernier scale</b>	Read fraction of smallest interval
3. <b>Inside jaws</b>	Measure internal diameter of object
4. <b>Outside jaws</b>	Measure external diameter of object
5. <b>Tail</b>	Measure depth of object

### How to use:

1. Read main scale which is immediate left of zero mark on vernier scale  
→ reading: x cm
2. Find the  $y^{\text{th}}$  vernier mark which coincides with marking on main scale  
→ reading: 0.0y cm
3. Diameter = (x + 0.0y) cm

### Check and correct zero errors

→ corrected reading = observed reading – zero error

Type	Observation
1. <u>No</u> zero error	<p>The diagram shows the zero mark of the Vernier scale aligned perfectly with the zero mark of the Main scale. The Main scale has markings at 0, 5 mm, and 10 mm. The Vernier scale has 10 divisions. Labels include 'Main scale', 'Vernier scale', and '10 divisions'.</p>
2. <u>Positive</u> zero error	<p>The diagram shows the zero mark of the Vernier scale aligned with the 3 mm mark of the Main scale. The Main scale has markings at 0, 5 mm, and 10 mm. The Vernier scale has 10 divisions. Labels include 'Main scale', 'Vernier scale', and '10 divisions'.</p>

3. Negative zero error

**Micrometer screw gauge**

How to use:

1. Read main scale reading to the immediate left of thimble edge  
→ reading: x mm
2. Find thimble reading y in line with datum line  
→ reading: 0.y mm
3. Length = (x + 0.y) mm

Check and correct zero errors

→ corrected reading = observed reading – zero error

Type	Observation
1. No zero error	
2. Positive zero error	
3. Negative zero error	

## 1.4 Measurement of Time

### How to measure time

Observation of natural events – repeat at regular intervals

Observation	Period	Explanation
1. <b>Seasons</b>	year	1) Spring 2) Summer 3) Autumn 4) Winter
2. <b>Phases of the Moon</b>	month	Full moon → crescent → full moon
3. <b>Sunsets</b>	day	Sun sets each day
4. <b>Position of the Sun</b>	time of day	<b>Sundial:</b> position of shadow cast by Sun differs according to time of day <ul style="list-style-type: none"> <li>• Noon: Sun high in sky</li> <li>• Evening: Sun low in western sky</li> </ul>

### Pendulum

Pendulum swings freely → move back and forth at regular intervals

- **oscillation:** complete to-and-fro motion
- **period:** time taken for 1 complete oscillation

Formula for period of pendulum

$$T = 2\pi \sqrt{\frac{l}{g}}$$

$T$  = period

$\pi$  = pi

$l$  = length of pendulum

$g$  = gravitational field strength

Factors affecting period

1. length of pendulum
2. gravitational field strength

[mass does not affect period]

Procedure to measure period of pendulum

1. Set the pendulum into oscillation – displace pendulum bob to one side by angle  $\theta$ , release it
2. Start recording time when the pendulum passes the equilibrium
3. Measure the time taken twice,  $t_1$  and  $t_2$  for the pendulum to make 20 oscillations
4. Determine the average time,  $t$  for 20 oscillations

$$t = \frac{t_1 + t_2}{2}$$

5. Determine period of pendulum,  $T$

$$T = \frac{t}{20}$$

**Atomic clock:** precise timekeeping device which modern timepieces are calibrated using

## Instruments to measure time

### Instruments

Instrument	Explanation
1. <b>Pendulum clock</b>	Keep time using pendulum's periodic swing
2. <b>Clocks</b>	Use <b>quartz crystals</b>
3. <b>Stopwatches</b>	1) Small 2) Accurate 3) Little electrical energy

### Human reaction time

- Take stopwatch reading to 1 d.p.
  - Stopwatch precision: 0.01s
  - Stopwatch started & stopped by hand
- 0.3 – 0.5 s

### Ticker tape timer: study motion of moving object

- Constant interval: 50 dots / second
- Speed measurement
  - Calculate total distance travelled,  $d$
  - Calculate number of intervals,  $n$  and thus the total time interval,  $t$

$$t = 0.02 n$$

- Calculate average speed,  $v$

$$v = \frac{d}{t}$$

- Determine tape pattern of trolley

Tape pattern	Motion of trolley	
	Distance per unit interval	Speed
 ← direction of movement	same	constant
 ← direction of movement	increasing	increasing (accelerating)
 ← direction of movement	decreasing	decreasing (decelerating)
